

## 10 Tourism as a future for local rail services?

### An analysis of debates in Akita prefecture\*

Peter Ackermann

In 2006, I travelled by rail from Hachinohe in Aomori prefecture through the mountains of Akita in Kuromedai, a remarkable journey into majestic forests, across wild rivers, and past ancient farm houses. The elegance and calmness of the rural people as they went about their work, or boarded the train left a deep impression (a considerable photograph in *Kasai 2006*). A few years later, I was back, this time in winter. The silvery beauty of the landscape, the brilliant blue skies and falling snowdrifts remain unforgettable. It was then claimed to find that the ANI was on the list of railways earmarked for closure, as deficits had reached astronomical levels (Kasai, 2010; Saito and Yamashita, 2011).

I wanted to investigate the actual situation in detail, as the railway was not some old relic. On the contrary, it had only been completed in 1988. I wondered what tourist potential this little railway had, considering that its southern point of departure, Kuromedai, is on the Shinkansen route from Tokyo. Can small railway lines contribute to a peaceful way of enjoying more remote regions, to green tourism, and to the revitalisation of villages through tourism? Was Japan keeping up with such developments as we have them from countries like Switzerland, France or Britain, and if so, did Japan have its own unique approach?

#### The Akita Nairiku Jittan Railway today

In 2012 the line evaluation to close 87m deficit could not be reduced to under 200 million yen (Saito and Yamashita, 2011; Hasegawa 2012; Saito, 2012; Akita-ken Kasai, 2012; Kasai, 2012). The main shareholders, who have the power to prosecute such a threat, are Akita prefecture (34.6 percent), Riza Akita City (controlling on Takamatsu (22.7 percent), Ueda City managing on Kuromedai (15.4 percent), local bodies (8 percent), others (10.3 percent)).<sup>1</sup>

The ANJ is an unusually long local line covering 94 kilometers in 23 hours. The population it served in 2010 stood at approximately 16,000 adults (compared with

Figure 10.1 The Aiki Niseko Jikuu Railway at Kami Station

Photograph: Peter Jakobsen

24,000 in 1990, 7000 persons under the age of 15 (compared with 14,000 in 1990), and 23,000 persons over 65 (compared with 13,000 in 1990) (Chubu Shinkansen, 2013).

How has the railway been used since its inauguration in 1989? In 1998, over one million passengers used the line;<sup>27</sup> in 2003 this figure had fallen to about 1000,000, in 2008 it stood at around 400,000, and in 2012 it had risen to 270,000. Data available for regular commuters, who in 2008 made up around 52 percent of the AN's traffic, show that the majority of the passengers are high school children (Ozaki, 2008). Due to the decrease in population this figure has since gone down. Non-regular local customers are mostly old persons, mostly doing errands or on their way to a regional hospital. Including regular commuters, the AN homepage lists non-regular customer figures from March to November 2012 as 116,269 people, March to November 2013 as 111,326 and March to September 2014 as 114,633; people Aiki Niseko Jikuu Teranishi Homepage, 2014.

The JR is not able to serve the entire population of the area. Especially in the north the settlements lie on the other side of the river, which makes the stations hard to reach. Also, there are bus services along most parts of the line, while the train route runs largely parallel to the AN. As the road has little traffic, it is easy to get and much faster than the train. Buses run from and to regional airports, and trains offer stops for individuals and groups en route of tourist journeys (Ozaki, 2008).

#### *Tourism as a driver for local rail services?* 141

Since 2000, the AN's distance has been consistently hovering around 230 to 260 million yen. Not surprisingly, the directors of the railway were in favour of closing the line (Shibay, 2004, 2005). Closure was imminent in 2005, but thanks to much support (Shibay, 2009) and a wiser concept of tourist development, the AN still operates (Adachi-Iwa Otsuk, 2012; Platten-Visser, 2012), although it suffered a blow in 2007, when most elementary and secondary school children were required to use special school buses (Ishizuka, 2011).

Apart from the depopulation of the region, heavy snowfalls have driven up costs, while tourists declined to a trickle in the part of Japan after the Great East Japan Earthquake of 2011 (Sato and Yamamoto, 2012; Lévesque, 2012).

A look at the history of the line gives insights. As mentioned, the JR started operation in 1989, after two existing branches had been connected through a new intermediate section. This new section, however, linked not just two quite-different railway lines but also two culturally and economically very different areas, the mountain valley of Aoi in the north and the Tazawa Lake plateau in the south. The cost for the construction of the Yatsushiro Tunnel, which is almost six kilometres long and now carries these two areas, was enormous (Aoi Kōsō, 1981). Local people say that there was no need for it, as there had never been contact between the villages on either side (Akiyama, 1999; Platten-Visser, 2012; Nishiochibatake, 2011).

Figure 10.2 Riding the Kami Niseko Jikuu Railway

Photograph: Peter Jakobsen

The construction of the line in the 1950s helps us to understand some of the problems that Japan's regions are struggling with. Historically, only the upper end of the northern section, built in 1916, had any importance, as it connected the former copper mines at Akiti to the main line from Akita to Aomori. The rest of the northern section continued through the valley as far as Himechimai was added in 1963. The southern cut-off-section from Kurokodate to the village of Matsuda started operating in 1971 and was earmarked for closure shortly after it had opened. Both cut-off-line lines were operated—and the districts paid for—by Japan's National Railways (JR) (Tetsudō Jihen, 1991; Tetsudō Jihen, 1993).

Considering the huge deficit, the declining passenger figures, deprivations, and the paucity of users in rural areas, the operation of the AN turned into a disaster. Services were cut, and bonus payments and other allowances for the employees stopped (Liverdink, 2012). Yet, the new director of the line, who was elected in 2001, argues that it shouldn't be abolished.

### **The history leading up to today's problems**

The line's awkward name Akita Minami Akita Tetsudō (railway running lengthwise through the interior part of Akita) suggests that a local sense of transport, but not the enjoyment of the region, stood in focus. Other small railways that were privatised were often given far more appealing names associated with tourist sites, such as Tōzai Iwanazumi Railway, referring to the wild Tōzai River and Lake Hamanako in Shizuoka prefecture, or Wakasa Kankō Railway, referring to the Wakasa Gorge in Chiba and Tottori prefectures.

Seeking to understand the neglected potential of a local railway like the AN, we need to consider the industrial and social changes in the 1960s, 1970s and 1980s by looking at three institutions, the National Railways, the Japan Railway Construction Corporation, and the so-called Third Sector railways.

As a railway and as one of Japan's most important employers, the National Railways of Japan (JR) played a significant role in the positive development of inter-regional communication (Tsunematsu, 1976; Yukimura, 1976). However, by 1984, rising expenditure, changes in transport needs, the decline of the coal industry, a strong concentration of the population in the large cities, and the use of private cars and improvements of road conditions, turned JR into a profitable enterprise but a loss-making business. Therefore, rationalisation measures and the plan to close 45 lines were propagated in 1986 (these lines were referred to as isolated child-birth lines, Special Local Traffic Lines, cf. Aoki et al., 1991; Tetsudō Jihen 1991, 1993).

JR's deficit grew and grew, trains were filthy and late, service became unreliable, while strikes and conflict between labor and management paralysed the JRK throughout the 1970s. The oil price shock of 1973 and the politically motivated referendum to raise fares made things worse. It was not until 1980 that, on the basis of the Tōzai Law (the JR Reorganisation Law) (Aoki et al., 1991; Tetsudō Jihen, 1991; Aoki, 1999), the government started to get rid

of the 80 lines (5,124 kilometers) scheduled for closure in 1988. However, at that time the Japan Railway Construction Corporation was still building new lines. When this activity was finally halted, hundreds of half-finished bridges, tunnels, and even complete railway systems all over Japan (Tsunematsu, 1976) were left to decay. Thanks to the JR Reorganisation Law, 79 lines could eventually be eliminated by the time JRK ceased to exist in 1987 (Tetsudō Jihen, 1999, 1993).

The Japan Railway Construction Corporation, which was established in 1964, located in Tokyo and run by former JR officials and Development Banks, built new railways with aid of government finances (Tsunematsu, 1976; Tetsudō Jihen, 1993; Yukimura, 2011).<sup>7</sup> With regard to the AN line, the Construction Corporation had completed the southern section by 1971, and since the Hidaka Tunnel was ready for use, it needs to be mentioned here that Prime Minister Takeo Kaneko (1972–1976) (see Sasaki, 1978), known for his *Nihon Renki Keizai-ron* (Japanese Autopurification Remodelling Plan) propagated in 1972, thought of railway transportation as a basic necessity for which the user should pay. Naturally, the local regions then limited their activities to lobbying for more lines, without feeling responsible for them (Tsunematsu, 1976).

In the 1980s, the construction ban on new lines was lifted under the condition that their necessity for local development was proved. In this context eliminating dead-end branch lines by connecting them to other lines was considered worthwhile in order to create new flows of traffic, and much engineering work on the future AN line had already been completed by the Railway Construction Corporation (Tetsudō Jihen 1990, 1991).

The AN opened as a Third Sector railway. "Third Sector" denotes an undertaking in which professional, regional and national administration (i.e., the Five Major's joint private businesses (*i.e.*, the Second Sector)), all sides accept financial and operational responsibility (Tetsudō Jihen 1983, 1993). Third Sector operations then appeared to guarantee flexibility and greater independence from rigid budgets. At the same time it became easier to take financial risks that were backed by the local government. In effect, this brought about a new role of the *chishū shakai* (Regional autonomy, regional communities), which recognised the need for localised or a variety of operations (Aoki, 1993; Suzuki, 1999; Nelly, 2001).<sup>8</sup>

When Third Sector railways started operating, their structure reflected the interests of the regions, including tourism. However, their efforts have often failed. There are several reasons for that. First, in many cases the responsibilities of the administration and the private sector were not clearly outlined. Local governments made losses, and the taxpayers had to pay the debts. Moreover, the responsibility of operating the railway often rested with ministers—or even related members—of local governments, while private businesses were quick to jump off as soon as the initial enthusiasm had evaporated. The focus of the public economy left the focus of many Third Sector railways fixed not on developments but on sheer survival. During that time, very few new operations were initiated despite the fact that competition from trucks, highway express buses and private car was growing fast.<sup>9</sup> To make things worse, although most Third Sector railways had received

depends of subsidies when they started business, hoping to operate largely on their interest, interest rates dropped to almost zero. Prices, however, were not raised due to fear of losing more passengers (Ozaki, 1999).

### Is there a future for the Akita Nairiku Railway as a tourist line?

An Kansuke Matsui and Takahashi Masayuki have described in their book *Chinki Kōsatsu* ('Clearing off the Regions') (2008), during the first decade of the 21st century Japan's central government pursued a policy whereby regions should be responsible for themselves. For that reason, regional governments came under severe pressure to reduce deficits. Yet one wouldn't have much visibility the former director of the AN, who was also the mayor of Kimi Akita City, actually invented when he resigned at age 71. He was replaced by manager Wakamori in 2009, a man from a polymer enterprise who was experienced in asset and tourist projects. Wakamori was under pressure to reduce the AN's deficit. However, he soon withdrew. This led to the next stage in Japan's decline about local lines. Now the keyword became *shiroi shōchi* (general managers found through public advertising) (Ozayoshi and Saitoh, 2011; Terada, 2012a).

The new manager of the AN, Saitoh Ichirō (aged 65 in 2012), is a man from Kyoto known for his success in restructuring the South Department Stores and specialised in the areas of public relations and advertising (Saitoh and Yamashita, 2012; INT 3). Saitoh sees the tourist railway business as a particular challenge, as—unlike department stores with mainly regional customers—such business needs to appeal to the entire country (Saitoh and Yamashita, 2012).

As mentioned, staff on the AN suffered cuts in pay and allowances (Lindström, 2012a), while the reduction of personnel has resulted in further savings. Saitoh himself was integrated in exchanges within the network of *shiroi shōchi* (Saitoh, 2012b, 2013; Terada, 2013c; Zen-ichi, 2013a), all of whom like to be out in the field talking to passengers and observing operations, often alongside—moving around personally (Takemoto, 2012a). For Saitoh, not just the railway line, but also its context is important. Visitors not only take a ride on the train, they are also interested in buying souvenirs like toys, hand towels, DVDs, and cakes. They also wish to enjoy communication and to dine on the train (Saitoh and Yamashita, 2012; Lindström, 2012). Moreover, the AN line is now being shown as an access point to dressing festivals and other regional events. Restaurants serve local food and cake, cultural centres display local hunting traditions, and archaeological sites, nature trails, mountain flora and waterfalls are advertised.<sup>7</sup>

Promotional activities in Tokyo highlight the beauty of the countryside along the AN. However, in Akita there are many attractions, the AN itself receives comparatively little attention. Moreover, the majority of pamphlets advertising the AN are published by JR and displayed at JR railway stations. Thus they obviously reflect JR's strategy in propagating its own special offers for railway trips through northern Japan. For instance in the *Akita Shinkansen* trains through the Shinano mountain range of the impressive *Genki*-Line along the coast, that at least one

21-page pamphlet published by JR East Japan (JR Higashiletsu Nihon, 2011) is fully dedicated to the AN, advertised as *Kakumotsu*. Moreau, data from *Shinkansen to Honsen*, then unions capital to unions capital.

The AN does not have an easy position competing with other attractions in Akita and northern Japan. In addition, maps tended indicate regionally operated railways such as the AN, in contrast to JR lines, in a bold visible way.

Local railway managers have begun to define regionally operated railways as regional assets within an overall tourism (Kondo, 2012a, 2013; Zen-ichi, 2013c; Matsushige, 2013a; Terada, 2013a). At the same time they warn that the "regions" are not Tokyo, in Tokyo, things will disappear but are quickly replaced by new things—in large cities this is a natural process (Akita tourism). In systems, when things disappear in the regions they have gone for good (Plaster-cook, 2012). Therefore, such assets as the AN need to be advertised.

In January 2013, an extensive 141-page report (Yuka Shigé Kōgyōkyō, 2013) pointed out that the attractive ancient samurai town of Kakunodate was not keen to include itself that it was the principle starting point for a trip on the AN. It will require much political skill to change this. The report also showed that 90 percent of the visitors to the AN (as opposed to its regular customers) come from outside Akita, mainly from Tokyo, yet the fact that it can be reached directly by Shinkansen needs far more advertising. Only 10 percent of the visitors to Kakunodate appeared to have travelled on the AN, while 40 percent said they had not even heard about the railway.

The AN itself has made great efforts in targeting women and children. This includes the director's call for more women to take place of the line (Kondo, 2012), which has been given the name Akita Bigin Line (by mounting "beautiful girl"). At the same time, the mascot figure Nairikōan (see Figure 10.1) appeals to children (Yamada, 2012b).

Much effort has gone into revitalising the railway with art. There have been remarkable picture displays of the line's beauty, or exhibitions of local art and objects made from bamboo/bamboo, while nearby art is presented on, i.e., giant pictures in paddies fields created by planting rice of various types and colour along the line attracts much attention. Also, the composition of haiku poems related to specific spots in nature is listed (Saitoh and Yamashita, 2012; Kondo, 2012; Akita-nishi, 2012a, 2012b; Yamada, 2012a). Furthermore, there is a steady flow of events, which take place in galleries and exhibitions, at festivals and as stage art, as well as various possibilities for outdoor integrated experiences of doing or purchasing something (Mitsuda, 2013b; Akita-nishi, 2013a).

For manager Saitoh one of the most highlighted elements of revitalisation is the sale of goods. A survey of January 2012 lists an amazing number of objects that could be sold for profit, many of them being regionally produced handcraft and souvenirs, or locally grown fruits and vegetables (Yuka Shigé Kōgyōkyō, 2013: 75–80). Some products, such as regional potatoes or chestnuts, are important ingredients for the production of cookies. Also, the railway line passes through one of the few remaining regions where the *takushū* plant—the original basis for Japanese starch—grows in large numbers.

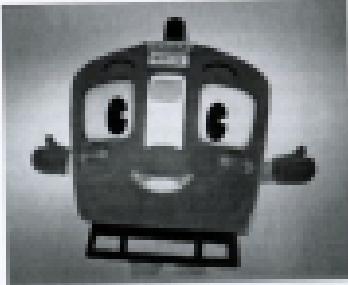

Figure 20.1 *Nishikitan*

The most eye-catching appeal of the line, however, is certainly linked to nature: child car drivers (the landscape is the central theme of the line) narrated numerous *Akita Happo Land* landscapes and culture of village *Ajutsu*. Akita's world-famous beauty, or in winter colour, is presented in a world of gleaming silvery-grey concepts. All this makes clear no tourists checking out the carriage windows in particular experience, while another "show off" – also forms a central appeal. These concepts are subsumed under the idea of *akita-ko* (Akita world) and marketed as *Akita no genki* (Akita landscape that speaks of the very basic system of Japanese identity) (Chiba and Yamada, 2012; Sasaki, 2012). To enable tourists to see all this landscape, the general information site of Third Sector railways in Akita proactively presents detailed information about the cultural and natural surroundings of every station (Akigato, 2014).

To convert a railway line into a tourist attraction will not be easy, and it is uncertain whether the local and aging population will go along with such a concept. Moreover, there a glimpse of the timetable of the AN, it is not evident whether this line were built primarily as a means of transport or as a means of tourism and recreation. Railways in other locations that formerly depend on tourism no longer serve local transport much and instead focus on providing attractive access to tourist centers, quite often in special passenger coaches.

Unfortunately, the AN has terminated its runs through to Himekita, the most important regional city it used to serve in the north,<sup>1</sup> because using the JR main line from Takamatsu (*kyūō*) was too costly. Moreover, it remains doubtful whether any one of the less frequented railway stops along the AN has sufficient potential to attract significant numbers of tourists.

As noted, Japan's large cities, especially Tokyo, appear to be the main source of visitors. A more manager who does not belong to the closed circle of "Old Boys" in Akita might be better able to tap this source. However, Akita's interior will always remain a cold and bleak place in winter. In 2011 even the Shinkansen

arrived late due to heavy snow. Another question is how far the powers of vacation in Japan will permit a substantial increase of visitors from Tokyo. In Japan, employees are sufficiently able to take longer vacations. Day-trips from Tokyo to Akita are non-existent, and the attractiveness of the AN might in the end depend on whether it can appeal to tourists who tend to the region to spend just over night there.

Finally, due to the nonexistence of tourist locations in Akita, it is essential to attract visitors who come by car, and to offer them an infrastructure that will enable them to move quickly from a car park to an attraction. However, new concepts demand caution, considering how many recent attractions have gone bankrupt in recent years. Attention must also be given to the fact that it is difficult to visit the smaller places of interest advertised on the AN homepage by train due to the sparse and irregular timetable. Finally, many of the locations for photographing the AN in its full beauty can only be reached from the road, and this does not contribute to the line's running costs.

A mixture of hope and doubt surrounds the AN. Can this unique railway line bring new sources of income by staging events and art festivals and offering regional products for sale? Can depopulation of the area be tackled by approaches which no longer reflect the local region?<sup>2</sup> At any rate, a more business-like approach promised by a later chief might be a first attempt towards a more sustainable revitalization of the AN and Akita prefecture.

## Postscript

In May 2014 director Sasaki suddenly stepped down. The reason for his departure remains obscure. Some say his understanding of the tourist railway business was limited (personal interview), while others say that Akita prefecture had a hidden agenda which aimed at quickly closing the railway (Yasugaki, 2014). Sasaki has been replaced by Senni Takashi, aged 59, whom from the region who was an officer at JTB (Japan Travel Bureau's) Akita branch and has close ties to the regional tourist industry (Iwata, 2014). In his blog (Takashi, 2014), the director of the relatively successful local Railway on the West Peninsula emphasizes Sasaki had drawn attention to the fact that a local population usually has no more interest in and no more need for a railway line. In fact, their attitude towards maintaining a railway can even be quite nasty (Yahoo! chōdōsho, 2004). Meanwhile, the AN continues to propagate really impressive artistic activity, such as Music Art riding: two of thousands of tiny photographs to create (image), or Chameau AN (Liuhe, 2014). A recent detailed description of the line is found in Akita Nihon Keisan Tōroku, 2013.

## Notes

1. Comprehensive data on the AN can be found in Wikipedia, 2013. See also Iwata/Yasugaki 2012 and Piko Shōji (Kenyōjin, 2013).
2. A description of the railway soon after it had opened is found in Akimoto (1999).

- For further details on the environmental and political context in which the Japan Railway Construction Corporation operated see Ito (2004).
- The main criteria for choosing the line on the construction of new railway lines included access to major cities, poor condition of parallel roads, especially in winter, prospects of economic results, the premise that the line would be operated by the local municipalities, and the promotion of tourism (selected lines by linking them to other lines by through running ref. Tomasi (1995)).
- For more on influences the decisions faced by Third Sector railways in relation of different aspects of local communities, A larger community situated on a hill line, for instance, may not be interested in a Third Sector branch line, especially if financial aid is required to sustain it. However, a smaller community on a hill line might feel that if the Third Sector branch line were closed, then its expenses would no longer stop at their station. There again, there are communities situated on or towards the end of a Third Sector branch line who would profit as expenses has already to a large city. On Third Sector railways see also Hasegawa (2004).
- Many articles since the 1990s draw attention to the fact that railways had lost their symbolic value. Aska et al. (1998) repeat of the disappearing railroads as a symbol of spiritual belief in railway lines. Saito (1999) illustrates the situation by concluding in that the only genuine Japanese rail road of our time are local bus routes without a railway line (no house will ever stand) is no longer true.
- Given tourism is particularly influenced by the managers of the Yatsugatake Railway, which is another Third Sector railway line in Akita prefecture (Ito et al., 2004; Oki, 2004; also Saito Yamamoto (2002)).
- A special train Maruyama Shigyo (Maruyama Leaf Flyer) along the foot of the Maruyama Mountain range was operated between Kubotanomori and Maruyama on October 19-20 and 26-27, 2013.

The role of Asia will be crucial in tackling the world's environmental problems. The primary aim of this series is to publish original, high quality, research-level work by scholars in both the East and the West on all aspects of Asia and the environment. The series aims to cover all aspects of environmental issues, including how these relate to economic development, sustainability, technology, society, and government policies, and to include all regions of Asia.

ROUTLEDGE STUDIES IN ASIA,  
AND THE ENVIRONMENT

## SUSTAINABILITY IN CONTEMPORARY RURAL JAPAN

Rural communities in Japan have suffered from significant depopulation and economic downturn in post-war years. Low birth-rates, aging populations, agricultural decline and youth migration to larger cities have been compounded by the triple disaster of 11 March 2011, which destroyed farming and fishing communities and left thousands of people homeless. This book identifies these challenges and acknowledges that an era of post-growth has arrived in Japan. Through exploring new forms of regional employment, community empowerment, and reverse migration, the authors address potential opportunities and benefits that may help to create and ensure the quality of life in depopulating areas and post-disaster scenarios. This book will be of interest not only to scholars of Japanese society but also to those outside Japan who are seeking new approaches for tackling depopulation challenges.

**Shigeyuki Iwasa** is a professor in the Research Faculty of Media and Communication, Hosei University, Japan.
